Projects

E-commerce Website:-

- When we develop web pages, **we can have a combination of HTML, JavaScript, CSS, and PHP in our pages.** This can sometimes get confusing. Remember, the PHP code is executed first at the server level and then stores the data in a database in real time.

Random-Color Generator:- of small files in HTML

We will be generating random numbers between specific ranges like 0 to 100 or 0 to 255. Basically, the minimum value we want to get from our random number generator is 0, and the maximum value can be whatever we want, like 100 or 255.
